

get\_exported\_entries

provides\_distribution

get\_distributions

```
graph LR; A[get_exported_entries] --> C[get_distributions]; B[provides_distribution] --> C;
```

The diagram illustrates a relationship where two separate entities, 'get\_exported\_entries' and 'provides\_distribution', both point to a single target entity, 'get\_distributions'. The arrows indicate a directional flow from the left-hand boxes to the right-hand box.
